Subject: **Apple Devices with Outdated Operating System**

As part of our ongoing commitment to network and data security for students and staff, the Information Systems department will be implementing a necessary security measure on Apple devices that have an operating system which cannot receive the latest software and security updates. These devices will be disabled as of **April 30, 2026**. Many of you have already had conversations this school year with your building IT tech. For those who have not, please reach out to your IT tech as soon as possible to get a list of the devices that will be disabled at your school or department.

The majority of the Apple devices that meet this criteria are 8+ years old. Disabling the device will render it unusable, however, data will not be wiped from these devices. If needed, your tech can work with the user to transfer data to a replacement device.

To prevent disruptions like this in the future and to ensure your staff and students are working with secure, reliable technology, you are strongly advised to implement a regular device rotation.

If you have any questions regarding this security measure or need assistance planning your device refresh cycle, please feel free to reach out to your IT tech.
